

Give Water-Give Hope

We Identified Recurring Problems & Found Solutions Through Research

At any one time, 40% of Malawi hand-pump wells fail.

Repair teams continued to make repairs with inferior parts. Over time, research started to solve this problem.

New SMARTPump solves four major points of failure in Afridev hand pumps

Re-engineered parts can handle field conditions better than original parts

128 SMARTPump units with satellite monitors installed in 2020-2021

After 290 days of use, 98% of our improved pumps are fully functional

\$50 a Month Makes An Impact

How monthly support benefits villages and our indigenous work force:

- Pumps produce an average of 40% more water for the user for the same effort
- Wells with improved parts produce clean water longer without failure
- Repair teams only need to return when our monitors show a problem, reducing repair costs and response time
- Continued research is resolving other existing issues for the future
- A repaired well is an open door to sharing more community improvement projects
